

CSIR 15th Dec 2019

Application No	191620012167
Candidate Name	MANTSHA ALI
Roll No.	UP0916200636
Test Date	15/12/2019
Test Time	9:30 AM - 12:30 PM
Subject	Life Sciences

Section : **Part A Life Sciences****Q.1** What day of the week will it be 61 days from a Friday?

- (1) Saturday
- (2) Sunday
- (3) Friday
- (4) Wednesday

Options 1. 1

2. 2

3. 3

4. 4

Question Type : **MSQ**Question ID : **1879801420**Option 1 ID : **1879805677**Option 2 ID : **1879805678**Option 3 ID : **1879805679**Option 4 ID : **1879805680**Status : **Answered**Chosen Option : **4****Q.2** A bag contains 8 red balls, 10 blue balls, 17 green balls. What is the minimum number of balls that needs to be taken out from the bag to ensure getting at least one ball of each colour?

- (1) 19
- (2) 18
- (3) 28
- (4) 27

Options 1. 1

2. 2

3. 3

4. 4

Q.8

An ice cube of volume 10 cm^3 is floating over a glass of water of 10 cm^2 cross-section area and 10 cm height. The level of the water is exactly at the brim of the glass. Given that the density of ice is 10% less than that of water, what will be the situation when ice melts completely?

- (1) The level falls by 10% of the side of the cube.
- (2) The level falls by 10% of the original height of the water column.
- (3) The level increases by 10% of the side of the cube and water spills out.
- (4) There is no change in the level of the water.

Options 1. 1

- 2. 2
- 3. 3
- 4. 4

Q.20

The result of a survey to find the most preferred leader among A, B, C is shown in the table.

<https://pathfinderacademy.in/>

Votes	A	B	C
1 st preference	13	54	33
2 nd preference	24	37	39
3 rd preference	63	9	28

First, second and third preferences are given weights 3, 2, 1, respectively. Statistically, which of the following can be said to represent the preferences of the voters?

- (1) A and C are within 10% of each other.
- (2) B is the most preferred.
- (3) B and C are within 10% of each other.
- (4) C is the most preferred.

Q.2

<https://pathfinderacademy.in/>

Which one of the following statements related to transcription and processing of mRNA is **INCORRECT**?

- (1) During prokaryotic transcription, DNA binding properties of RNA polymerase are altered by sigma factor
- (2) In eukaryotic transcription, synthesis of rRNA, mRNA and some small RNAs occurs by RNA polymerases I, II and III, respectively
- (3) Splicing observed in tRNA involves successive/sequential cleavage and ligation reactions while pre-mRNA splicing proceeds through lariat formation
- (4) mRNAs with premature stop codons are degraded by Nonsense-Mediated Decay (NMD) and mRNAs without an in-frame stop codon get accumulated and translated in the cytoplasm.

Q.43

In a form of stress response, bacteria synthesize a group of proteins called stress proteins (or heat shock proteins) such as DnaK, DnaJ, GroEL, GroES, and GrpE. DnaK is an ATP binding protein, which attaches to the newly synthesized polypeptide in conjunction with DnaJ. Which one of the following statements correctly states a step in the subsequent process of protein folding?

- (1) The affinity of DnaK to the polypeptide increases upon hydrolysis of the ATP to ADP.
- (2) DnaJ is an exchange factor that replaces ADP with ATP in DnaK
- (3) ATP hydrolysis is required for the phosphorylation of DnaJ
- (4) ATP hydrolysis is required for the phosphorylation of GrpE

Q.49

Which one of the following statements related to molecular cloning procedures is **INCORRECT**?

- (1) 5' overhangs of restricted DNA fragments can be blunt-ended by Klenow polymerase but not by DNaseI.
- (2) A DNA fragment obtained as an XhoI fragment (C↓TCGAG) may be ligated at the SalI site (G↓TCGAC) in a vector.
- (3) To prevent self-ligation of a vector digested with KpnI (GGTAC↓C), alkaline phosphatase enzyme is used to remove 3'-PO₄ groups from the ends of fragments.
- (4) α-complementation/blue-white screening may produce blue coloured recombinant colonies (containing cloned fragments) in case of translational fusion with the β-galactosidase gene.

Q.1

The nucleosome is the fundamental subunit of chromatin in eukaryotes. Following statements are made about nucleosome:

- A. Generally, a typical nucleosome contains ~200bp of DNA and two copies of each histone (H2A, H2B, H3 and H4)
- B. 146 bp length of DNA per nucleosome core particle is strictly maintained across the organisms
- C. The histone octamers are not conserved during/after replication, however, H3₂-H4₂ tetramers are.
- D. Variants have been identified for all core histones except histone H3
- E. While wrapping around the core histones, the structure of DNA is altered at the middle of the nucleosome core particle and exhibits increased number of base pairs per turn

Which one of the following combination of statements is most appropriate?

- (1) A, C and E
- (2) A, B and D
- (3) B, D and E
- (4) A, C and D

Options 1. 1
2. 2
3. 3

Q.3

The following statements are made regarding developing a transgenic mouse:

- A. The transgenic mouse thus born will be a homozygous transgenic animal and can be maintained by crossing with another transgenic animal.
- B. The fertilized transgenic eggs are allowed to develop *in vitro*.
- C. The desired gene is preferably microinjected in male pronucleus after sperm entry in oocyte.
- D. For best efficiency, the desired gene is always microinjected in the male gametes and then they are allowed to fertilize the female gametes.
- E. Blastocyst stage embryos are transferred to the uterus of hormonally prepared mother.
- F. The fertilized eggs are collected from specific strain of mouse.
- G. The female mouse of specific strain is superovulated, oocytes are collected and allowed to fertilize *in vitro*.

Choose the combination of statements arranged in the correct sequence for developing transgenic mouse.

- (1) $G \rightarrow C \rightarrow E$
- (2) $F \rightarrow C \rightarrow B \rightarrow A$
- (3) $G \rightarrow D \rightarrow A$
- (4) $D \rightarrow F \rightarrow B \rightarrow A$

Q.5 Following statements were made about the post-transcriptional processing of RNA in eukaryotes.

- A. Soon after transcription initiation, RNA polymerase II pauses ~30 nucleotides downstream from the site of initiation until the Cap structure is added to the 5' end of the nascent pre-mRNA.
- B. The 5' splice sites are functionally divergent whereas the 3' sites are functionally equivalent.
- C. In addition to helping in recognition of the splice sites, the exon definition also functions as a splicing regulator by allowing pairing and linking of adjacent 5' and 3' splice sites.
- D. The intron definition mechanism applies only to the larger introns (above 500 nucleotides length) and assists in achieving alternate splicing.
- E. The splicing reactions carried out in vitro have revealed that the first and second transesterification reactions are reversible.

Which one of the following combination of statements is correct?

- (1) A, B and D
- (2) B, C and D
- (3) B, D and E
- (4) A, C and E

Q.6

Analysis of a homotetrameric protein and a double stranded DNA (that had been incubated in standard buffer) on native gels revealed that they migrated true to their physical states (tetrameric nature of the protein and double stranded nature of the DNA). Following hypotheses were made for the effect of adding high salt to the incubation mix and subsequent analysis on native gels.

- A. The protein would migrate as a homotetramer and DNA in double stranded form.
- B. The protein would migrate as a monomer but DNA in double stranded form.
- C. The protein would migrate as a homotetramer but the DNA in single stranded form.
- D. The protein would migrate as a monomer and the DNA in single stranded form.

Which of the following combination of hypotheses is most likely?

- (1) A and B
- (2) B and C
- (3) C and D
- (4) A and D

Q.7

Given below are a few statements on use of plant breeding to develop improved varieties of a crop plant:

- A : Genotypic/phenotypic variation in the desired trait should be available in the germplasm resources of the crop plant.
- B : Availability of molecular markers linked to the trait of interest would decelerate the process of trait introgression into desired varieties.
- C : Breeding procedures to improve plant varieties are generally more successful among sexually compatible species as compared to sexually incompatible species.
- D : Co-dominant molecular markers cannot be used for selection of plants with the desired trait.

Which of the above statement(s) is/are **INCORRECT**?

- (1) A and C
- (2) B only
- (3) C and D
- (4) B and D

Q.9

The following diagram represents a longitudinal section through an *Arabidopsis* shoot apical meristem (SAM) and leaf primordium at its flank. The dorsal (D) and ventral (V) domains are marked. The *D* and *V* genes are expressed in the dorsal and ventral domains, respectively.

Consider the following statements describing the phenotypes of leaf polarity.

- A. Loss of *D* function makes the leaf ventralized whereas its overexpression dorsalizes the leaf.
- B. Loss of *V* function makes the leaf dorsalized whereas its overexpression ventralizes the leaf.
- C. Loss of microRNA miR166 dorsalizes the leaf whereas its overexpression ventralizes the leaf.
- D. miR166 functions by inhibiting its target mRNA.

Q.11

The phylogeny below shows evolutionary relationships between 9 extant bird species and whether they display red or blue plumage.

Based on the above phylogeny and the distribution of red and blue character states among the extant species, and using the principle of parsimony, which of the following is the correct inference about plumage colour of the ancestor at the root P?

- (1) Ancestral state at P is blue.
- (2) Ancestral state at P is red.
- (3) Ancestral state at P is more likely to be red than blue.
- (4) Ancestral state at P is equally likely to be red or blue.

Q.12 In an organism, a^+ allele governs gray body colour, while its mutant allele a gives yellow body colour. Further, presence of b^+ allele gives long and thin hairs while b allele gives rise to short and thick hairs. The alleles a^+ and b^+ are dominant over a and b , respectively. An individual with the genotype

$$\begin{array}{cc} a^+ & b^+ \\ \hline a & b \end{array}$$

has a patch of yellow cells with short and thick hairs. Which one of the following events is most likely to lead to the above?

- (1) Non disjunction of the homologous chromosomes during mitosis
- (2) Somatic recombination involving a and b
- (3) Translocation occurring in a few somatic cells
- (4) Mutation of both a^+ and b^+ alleles in the somatic cells

Q.13 A mutant mating type *mt* strain of *Chlamydomonas* that was resistant to the antibiotic kanamycin (*kan^r*) and herbicide PPT (*ppt^r*) was crossed to a wild type mating *mt⁺ kan^s ppt^s* strain that was sensitive to kanamycin and PPT. Twenty tetrads of the progeny were analyzed for mating type and resistance/sensitivity to kanamycin and PPT. The following observations were made:

	Type I	Type II	Type III
	<i>mt kan^r ppt^r</i>	<i>mt kan^r ppt^s</i>	<i>mt kan^r ppt^r</i>
	<i>mt kan^r ppt^r</i>	<i>mt kan^r ppt^s</i>	<i>mt kan^r ppt^s</i>
	<i>mt⁺ kan^r ppt^s</i>	<i>mt⁺ kan^r ppt^r</i>	<i>mt⁺ kan^r ppt^r</i>
	<i>mt⁺ kan^r ppt^s</i>	<i>mt⁺ kan^r ppt^r</i>	<i>mt⁺ kan^r ppt^s</i>
Number of each type observed	8	9	3

The following statements were made to explain the observations:

- A. *mt* and *ppt* loci are on two different chromosomes
- B. Inheritance of mating type and *ppt*-resistance/sensitivity are demonstrating cytoplasmic inheritance
- C. Inheritance of kanamycin-resistance/sensitivity is demonstrating nuclear inheritance
- D. Nuclear inheritance is being demonstrated by mating type and *ppt*-resistance/sensitivity analysis

Which one of the combinations of above statements is correct?

Q.17

A "morphogen" can determine the fate of a cell by its concentration. Given below are some statements on the experiment performed to study the gradient-dependent effect of the morphogen, activin on cell fate by placing activin (4 nm)-secreting beads on unspecified cells from an early *Xenopus* embryo:

- A. Beads without activin did not elicit expression of either *Xbra* or *goosecoid* genes.
- B. Cells nearest to the beads getting highest concentration of activin induced *goosecoid* gene whose product is a transcription factor, specifies the frog's dorsal-most structures.
- C. Cells nearest to the beads getting highest concentration of activin induced *Xbra* gene whose product is a transcription factor, specifies the frog's dorsal-most structures.
- D. Cells farthest from the beads getting negligible activin activate *Xbra* gene and become blood vessels and heart.
- E. Cells farthest from the beads getting negligible activin, activated neither *Xbra* nor *goosecoid* and the 'default' gene expression instructed the cells to become blood vessels and heart.
- Which of the above observations and conclusions drawn are correct?

Q.21

Thousands of proteins that are synthesized in the cytoplasm are imported into the nucleus through the nuclear pore complex (NPC) every minute. These proteins contain Nuclear Localization Signal (NLS) that direct their selective transport into the nucleus. This nuclear import requires:

- A. A small monomeric G-protein Ran.
- B. A nuclear transport receptor that interacts with the NLS on a cargo protein.
- C. A GTPase activating protein (GAP) bound to the chromatin tethered to the nuclear membrane.
- D. A Guanine Exchange Factor (GEF) bound to the chromatin inside the nucleus.

Which one of the following options represents all correct statements?

Q.22

A pedigree shown below depicts that the individual I-1 is heterozygous for a dominant disease allele D and for molecular markers $M1/M2$. The paternal molecular markers present in the progeny individuals are indicated in the pedigree.

The following statements may be drawn from the above pedigree:

- The two loci D/d and $M1/M2$ appears to be linked
- The recombination frequency between the two loci is 20%
- If LOD score comes out to be 3, then it ensures that the two loci are independently assorting
- A LOD score <1 would have ensured that the two Loci are linked

Which combination of the above statements can correctly interpret the depicted pedigree?

- C and D
- Only C
- A and B
- Only D

Q.23

Consider the following facts:

- Chlorophyll absorbs more in the red region of the visible spectrum than in far-red.
 - The phytochrome photoreceptor (P) of plants occurs in two inter convertible forms, P_r and P_{fr} where red light converts P_r to P_{fr} and far-red light converts P_{fr} to P_r .
 - Growing a sun plant under the canopy shed causes increased stem elongation
- Which one of the following combination of statements is correct for the plants growing under the canopy as compared to those growing above the canopy?

- Red:far-red ratio is lower; $P_r:P_{fr}$ ratio is higher; P_{fr} inhibits stem elongation.
- Red: far-red ratio is higher; $P_r:P_{fr}$ ratio is higher; P_r inhibits stem elongation.
- Red: far-red ratio is lower; $P_r:P_{fr}$ ratio is lower; P_{fr} promotes stem elongation.
- Red: far-red ratio is higher; $P_r:P_{fr}$ ratio is lower; P_r promotes stem elongation.

Q.24 Given below are some physicochemical properties (column X) and their manifestations (column Y).

	X		Y
A.	Pauling electronegativity	(i)	Charge separation
B.	Isolated π -orbital overlap	(ii)	Solvation of atoms
C.	Aromaticity	(iii)	Restricted rotation
D.	Dielectric constant	(iv)	Planarity of molecules

Which one of the following is the most appropriate match?

(1) A = i, B – iv, C – ii, D – iii

(2) A = iii, B – ii, C – iv, D – i

(3) A = ii, B – iii, C – iv, D – i

(4) A = iv, B – ii, C – i, D – iii

Q.31

Many organisms encode only 18 aminoacyl-tRNA synthetases (aaRS). These organisms lack aaRS that use Asn or Gln (as one of the substrates) for direct aminoacylation of the tRNA^{Asn} and tRNA^{Gln}, respectively. Which one of the following statements represents the correct option?

- (1) The organisms lacking AsnRS and GlnRS lack Asn and Gln in their proteins.
- (2) In these organisms, selected Asp and Glu residues in the proteins are post-translationally modified by a regulated mechanism.
- (3) In these organisms, the tRNA^{Asn} and tRNA^{Gln} are first aminoacylated by AspRS and GluRS, respectively, and then the Asp and Glu attached to the tRNAs are modified to Asn and Gln, respectively.
- (4) In these organisms, the precursors of mRNAs that encode AspRS and GluRS are alternatively spliced to generate AsnRS and GlnRS.

Options 1. 1

Q.33 Absorption spectra of L-tyrosine in acidic (continuous line) and basic (dotted line) medium was estimated and plotted on a graph as depicted below:

Following interpretations were made:

- A. Change in the pH from acidic to basic results in shift in the lowest energy absorption maximum and decrease in the molar absorptivity.
- B. Shifting of the absorption band to longer wavelength signifies a shift to lower energy, also known as red shift.
- C. Shifting of the absorption band to shorter wavelength signifies a shift to higher energy, also known as blue shift.
- D. Wavelength shift is always accompanied by change in intensity of the absorption band.

Select the combination with correct interpretations.

Q.34

An individual is having a paracentric inversion (denoted by the region f-e-d, marked by arrows) in homozygous condition.

<https://pathfinderacademy.in/>

The meiotic consequences of inversion can be:

- A. generation of an acentric and a dicentric chromosome
- B. the recombinants will have long deletion or duplication and may be lethal
- C. the inversion will suppress crossing over
- D. all gametes will have complete genome and will survive normally

Which of the above statement or their combinations will explain the meiotic consequence of the given inversion logically?

- (1) A, B and C
- (2) A and B
- (3) B and C
- (4) Only D

Q.35 Bacterial infections are generally divided into two broad classes: intracellular and extracellular bacterial infections. Given below are some of the properties which are applicable for bacterial infections.

- A. Humoral immune response is the main protective response against extracellular bacteria.
- B. Innate immunity is not effective against intracellular bacterial pathogens.
- C. Bacterial endotoxins do not induce an innate immune response.
- D. Intracellular bacterial infections generally induce a cell-mediated immune response resulting in secretion of cytokines which activate macrophages.

Which one of the following combination of statements is correct?

- (1) A and B
- (2) B and C
- (3) C and D
- (4) A and D

Q.36

Cells are physically linked to one another and to extracellular matrix through their cytoskeleton and this imparts strength and rigidity of tissues and organs. Most of the animal cells have three types of cytoskeletal filaments, which are listed in Column A. The possible functions are listed in Column B.

Column A	Column B
A Intermediate filaments	i Determine the shape of cell surface and are necessary for cell locomotion
B Microtubules	ii Maintain the position of membrane- enclosed organelles and provide intracellular transport
C Actin filaments	iii Provide mechanical strength of a cell

Which one is the correct match?

(1) A – i; B – ii; C – iii

(2) A – ii; B – i; C – iii

(3) A – iii; B – ii; C – i

(4) A – iii; B – i; C – ii

Q.37

Following statements are made about double-strand break repair (DSBR) model of homologous recombination:

- A. Process of DSBR recombination is triggered by introducing a double-strand break in a DNA duplex
- B. In a process known as 3'-end resection, the exonucleases along with a DNA helicase degrade one strand on either side of the break and generates 3'-single stranded termini
- C. One strand of the donor duplex is displaced due to formation of heteroduplex DNA and generates a displacement loop (D-Loop)
- D. Branch migration allows the point of crossover to move in 5' → 3' direction of recipient strand
- E. Completion of DSBR recombination may generate either crossover recombinant or non-recombinant product

Which one of the following combination of statements is correct?

- (1) A, B and D
- (2) A, C and E
- (3) A, C and D
- (4) A, B and E

Q.38 In the table below Column A lists ligands and Column B lists classes of receptors

Column A	Column B
A Serotonin	i Binding activates a G-protein which activates or inhibits an enzyme that generates a specific second messenger and opens ion channel
B Interferons	ii Binding causes receptor monomers to dimerize. Dimeric receptor then interacts with and activates one or more cytosolic tyrosine protein kinases
C Glycine	iii Binding changes the conformation of the receptor so that specific ions flow through it
D Insulin	iv Binding leads to activation of intrinsic tyrosine kinase activity

Which one is the correct match?

- (1) A – i; B – ii; C – iii; D – iv
- (2) A – ii; B – iii; C – iv; D – i
- (3) A – iii; B – iv; C – i; D – ii
- (4) A – iv; B – i; C – ii; D – iii

Q.39 Following statements are being made regarding specification/determination during animal development:

- A. During the course of commitment, the cell may not appear different from its nearest or most distant neighbours in the embryo and show no visible signs of differentiation; but its developmental fate is restricted.
- B. At the stage of specification, cell commitment is not labile.
- C. A cell or tissue is determined when it is capable of differentiating autonomously even when placed into another region of the embryo, or a cluster of differently specified cells in a petri-dish.
- D. Cytoskeletal arrangements maintain positioning of nuclei in the syncytium, which enables specification of these nuclei by opposing morphogen gradients namely Bicoid and Caudal in *Drosophila*.
- E. Capacity for "mosaic" development allows cells to acquire different functions as a result of interactions with neighbouring cells.

Which of the above statements are correct?

- (1) A, B and C
- (2) B, C and D
- (3) C, D and E

Q.48

Thyroid hormone (T_3) increases the heart rate and the force of contraction of cardiac muscles. The mechanisms of these effects of T_3 have been explained by a researcher in the following statements:

- A. T_3 inhibits the expression of gene for α -myosin heavy chain and enhances the expression of gene for β -myosin heavy chain
- B. The expression of gene for Na^+-Ca^{++} antiporter is enhanced by T_3
- C. The sarcoplasmic reticulum Ca^{++} ATPase is increased by T_3
- D. T_3 increases ryanodine Ca^{++} channels in the sarcoplasmic reticulum
- E. The number of β -adrenergic receptors in heart muscles is inhibited by T_3

Which one of the following combinations contains both correct explanations?

- (1) A and B
- (2) B and C
- (3) C and D
- (4) D and E

Options 1. 1

Q.49

In the following pedigree three STR loci A, B and C are linked on the long arm of the X-chromosome in the order centromere-A-B-C-telomere. Further in the table, the STR alleles present in each individual is indicated.

Loci	Generation									
	I				II		III			
	1	2	3	4	1	2	1	2	3	4
A	5,6	4	5,6	4	4,6	6	6	4	6	6
B	7,8	9	8,9	7	7,9	8	8,9	9	7	7,8
C	1,2	2	1,2	3	1,2	1	1,2	2	2	1

Based on the above, X-chromosome(s) in which of the following individuals are recombinant?

[Hint: X-chromosome in males will help identify the phase of the alleles]

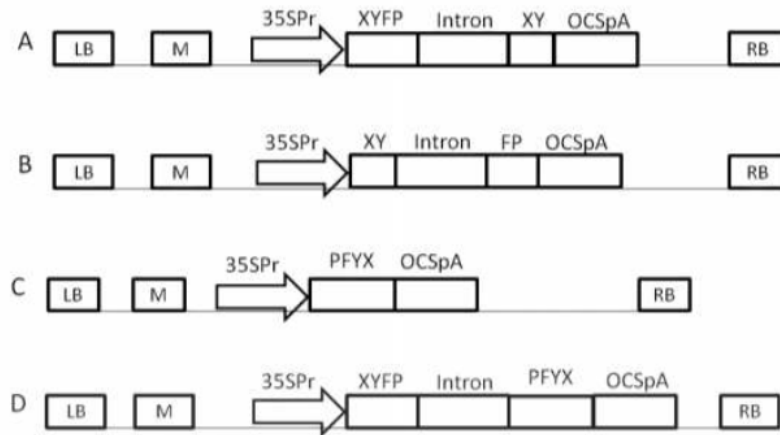

- (1) II – 1, III – 1 and III – 2
- (2) II – 2, III – 1 and III – 2
- (3) III – 1 and III – 3
- (4) III – 2 and III – 4

Q.59

Ribosomes prepared from a bacterium were fractionated by sucrose density gradient centrifugation (panel i) to separate the 30S, 50S and 70S populations. When the ribosome preparation was incubated individually with either elongation factor-G (EF-G), or a newly identified protein X, or GTP, the profile remained unchanged. Likewise, no changes were seen in the profile when the ribosomal preparation was incubated with EF-G + GTP or protein X + GTP. However, when the ribosomal preparation was incubated with protein X, EF-G and GTP together, it resulted in a change of profile which showed a decrease of the 70S peak area and increase in the peak areas for 30S and 50S (panel ii).

Choose the option that defines a correct conclusion from the observations.

- (1) Protein X is an anti-association factor which functions in the presence of EF-G and GTP
- (2) Protein X is a dissociation factor which functions in the presence of EF-G and GTP
- (3) Protein X binds GTP
- (4) EF-G is known to bind GTP, hence it can be concluded that the effect of GTP is through EF-G and protein X does not bind GTP.

Q.62

During cell cycle, entry in the S-phase is tightly regulated. This is possible because:

- A. APC/C promotes ubiquitination of S-phase cyclins and mitotic cyclins, marking them for proteolyses at the mitotic exit.
- B. Cyclin B1 helps in the activation of S-phase CDKs only in late G1.
- C. As mitotic CDK activity declines in late mitosis, cdc14 phosphatase activates APC/C by dephosphorylating Cdh1, thus promoting formation of APC/C^{Cdh1}.
- D. Securin keeps S-phase cyclins in inactive state till late G1.

Which one of the options represents all correct statements?

Q.72 Aldosterone increases the reabsorption of Na^+ from the tubular fluid in the thick ascending limb of loop of Henle and in the distal tubule. These effects are explained in the following proposed statements:

- A. Aldosterone increases the number of $\text{Na}^+\text{-Cl}^-$ symporter in the apical membrane of principal cells in the early portion of distal tubule
- B. The number of Na^+ channels (ENaC) is increased in the apical membrane of principal cells in the late portion of distal tubule by aldosterone
- C. The synthesis of Na^+ , $\text{K}^+\text{-ATPase}$ in the basolateral portion of principal cells in distal tubule is decreased by the action of aldosterone
- D. Aldosterone increases the reabsorption of Na^+ across the apical cell membrane in the thick ascending limb of loop of Henle by decreasing Na^+ , $\text{K}^+\text{-ATPase}$ in it

Which one of the following combinations represents both correct statements?

- (1) A and B
- (2) B and C
- (3) C and D
- (4) A and D

Options 1. 1

2. 2

3. 3

4. 4

Q.73

In the nervous system, the action potential is generated at the axon hillock in physiological conditions and it is conducted to the terminal end of axon. The location specific origin of action potential and its direction-specific conduction are explained by a researcher in the following proposed statements:

- A. The membrane of axon hillock has highest threshold for the generation of action potential
- B. The membrane of axon hillock contains large numbers of voltage-gated Na^+ channels and that makes it more excitable
- C. The propagating action potential in the middle of the axon cannot generate another action potential in the direction of cell body since a large fraction of voltage-gated Na^+ channels in the preceding portion is voltage inactivated
- D. As the number of voltage-gated Na^+ channels is less in the preceding portion of axonal membrane, the propagating action potential in the middle of the axon cannot generate another action potential in the direction of cell body.

Which one of the following combinations represents both correct explanations?

- (1) A and B
- (2) B and C
- (3) C and D
- (4) A and D

Options 1. 1

2. 2

3. 3

4. 4

Q.74

Strain A mice were crossed with strain B mice and first generation F_1 mice were obtained, i.e. $(A \times B)F_1$. A scientist then implanted thymectomized and irradiated $(A \times B)F_1$ mice with a B-type thymus and then reconstituted the animal's immune system with an intravenous infusion of $(A \times B)F_1$ bone marrow cells. The chimeric mice were infected with lymphocytic choriomeningitis virus (LCMV) and the spleen T cells were then tested for their ability to kill LCMV-infected target cells from the strain A or strain B mice.

Which one of the following is the correct outcome of the experiment?

- (1) LCMV-infected target cells from strain A only will be killed
- (2) LCMV-infected target cells from strain B only will be killed
- (3) LCMV-infected target cells from both strain A and B will be killed
- (4) Neither cells from strain A nor from strain B will be killed

Options 1. 1

2. 2

3. 3

4. 4

Q.75 The table below shows photosynthetic type, temperature and sunlight intensity levels.

Photosynthetic Type	Temperature	Sunlight Intensity
A. C ₃ Plant	i High	P. High
B. C ₄ plant	ii Moderate	Q. Moderate
	iii Low	R. Low

Which of the following correctly matches the plant photosynthetic type with the temperature and sunlight conditions in which photosynthetic rate per unit leaf area is maximum for that plant?

- (1) A – i – P ; B – iii – R
(2) A – iii – P ; B – i – Q
(3) A – i – R ; B – ii – Q
(4) A – ii – Q ; B – i – P

Options 1. 1
2. 2
3. 3
4. 4
